THAPAR INSTITUTE OF ENGINEERING AND TECHNOLOGY

DeadlineDesk

A Campus Web System for Placement Rounds and Academic Assignment Deadlines

WEEK 7 PROTOTYPE PRESENTATION

Aryan Gupta (1024030764) · Aksh Goyal (1024030766) · Naveen Bansal (1024030767)

Three-sentence summary

Problem

Placement rounds and assignment cutoffs are scattered across WhatsApp, Drive folders, and LMS notices.

Approach

DeadlineDesk unifies a Placement Track and an Academic Dropbox in one role-based web system.

Outcome

Students complete checklists and submissions on time; TAs apply late policy consistently; progress is measurable.

Why the project is needed

Placement side

- Company rounds tracked in sheets and chats
- Document checklists are informal
- Reminders are ad-hoc; windows are missed

Academic side

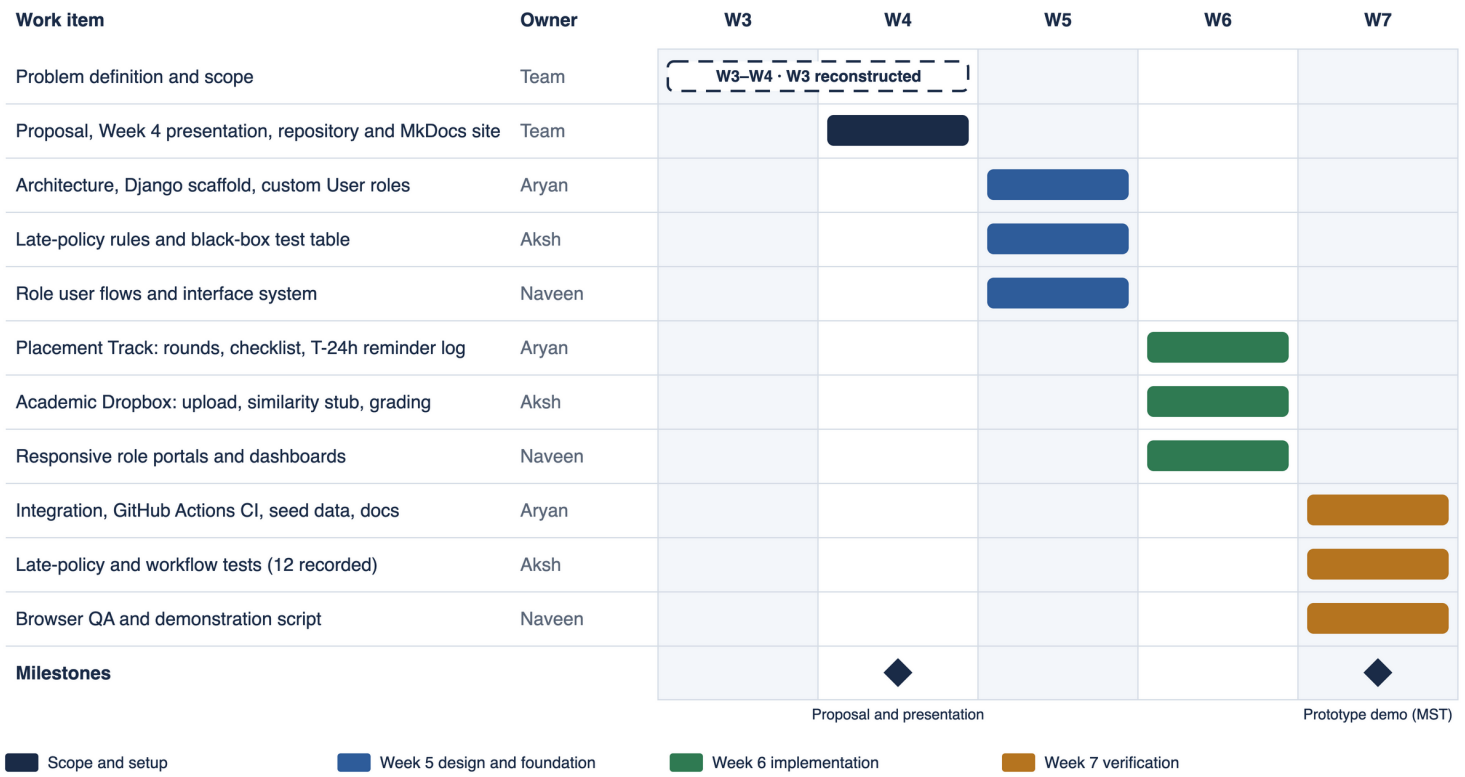

- Submissions via Drive or email
- Late policy applied manually
- Grade and late status lack transparency

Stakeholders: students, teaching assistants / faculty, placement coordinators.

Project schedule through Week 7

DeadlineDesk Project Schedule — Weeks 3 to 7

Week-level Gantt chart from the proposal delivery table and the Week 4–7 team journals (no day-level estimates)

Dashed bar: Week 3 is reconstructed from the proposal's combined W3–W4 row; no Week 3 journal exists. Owners follow each member's Week 5–7 journal. Git history was uploaded in batches, so commit dates are not used to date weeks.

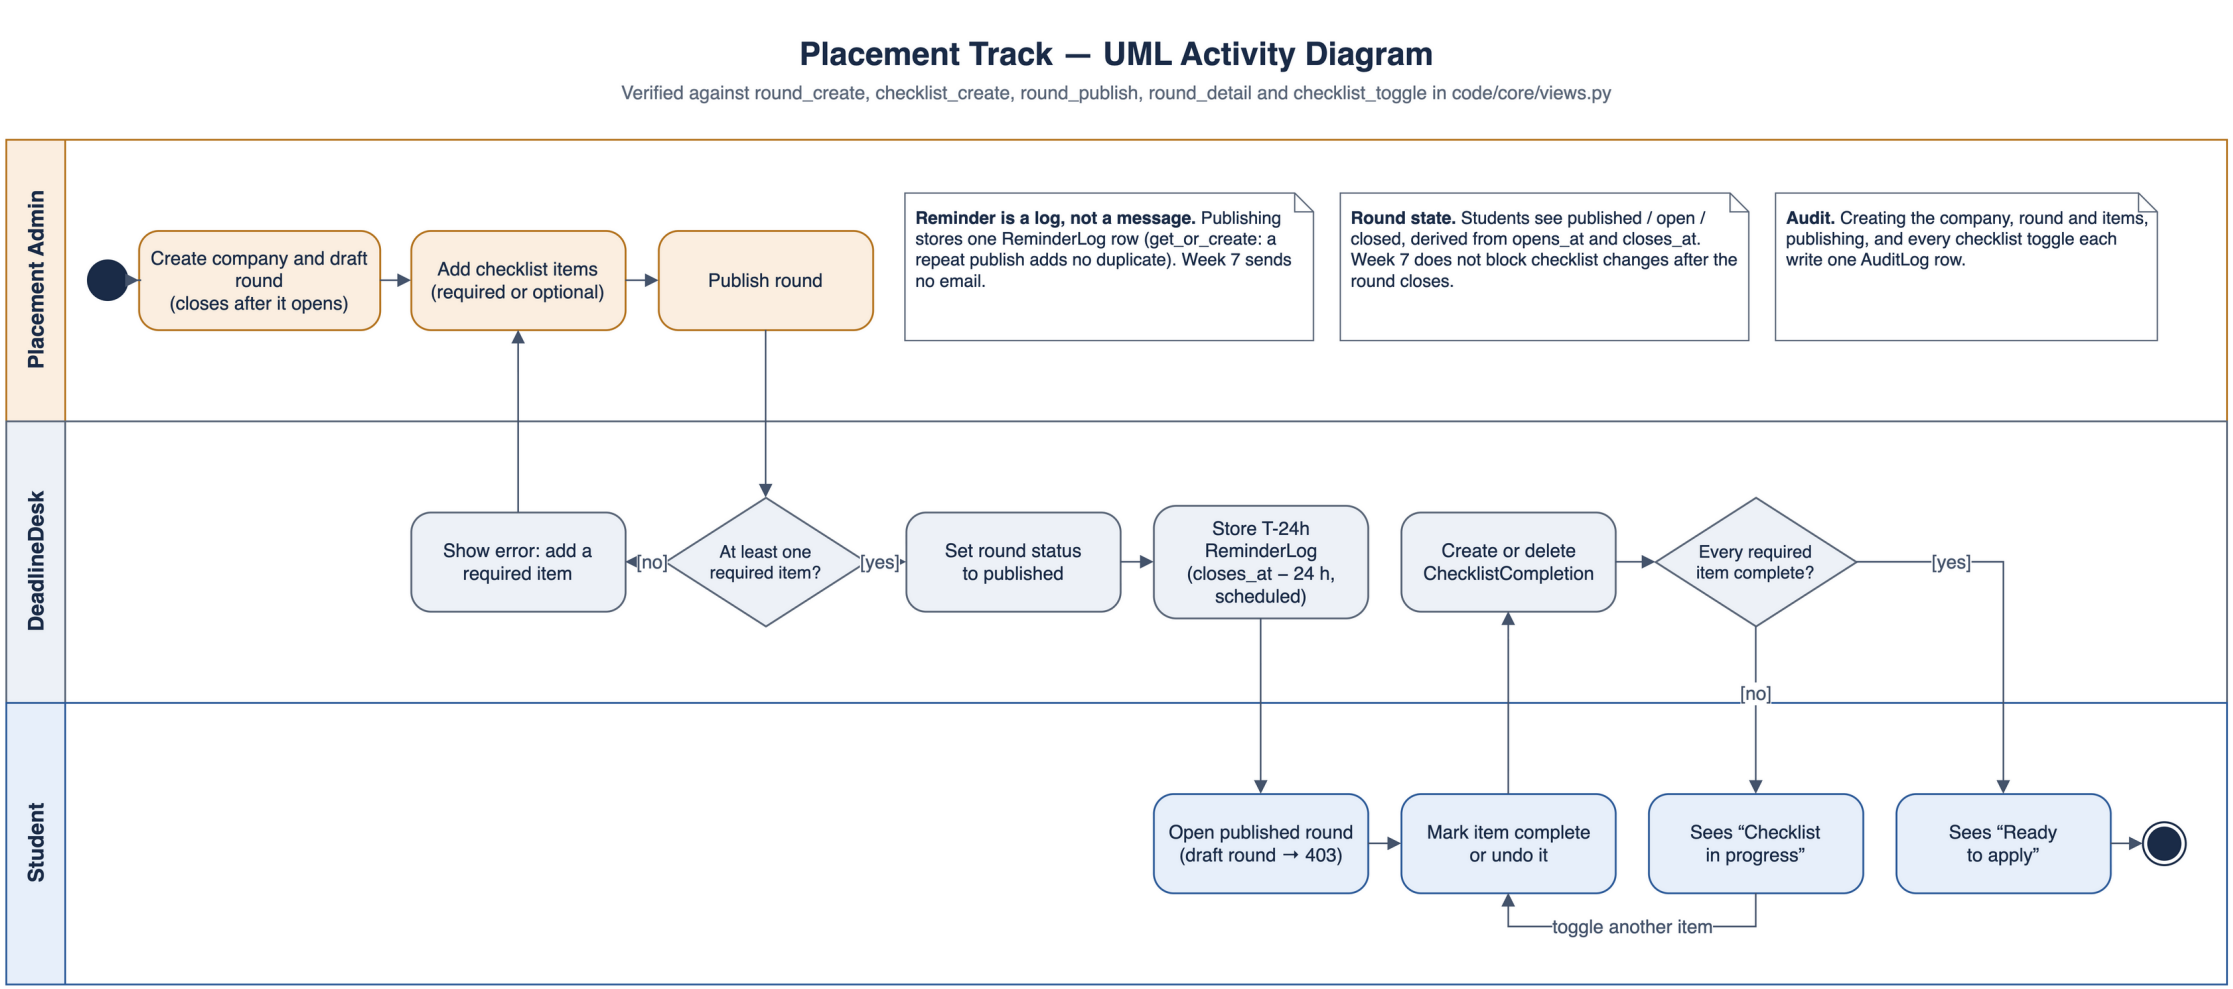

Frontend, backend and data

DeadlineDesk is one Python/Django web application with server-rendered pages.

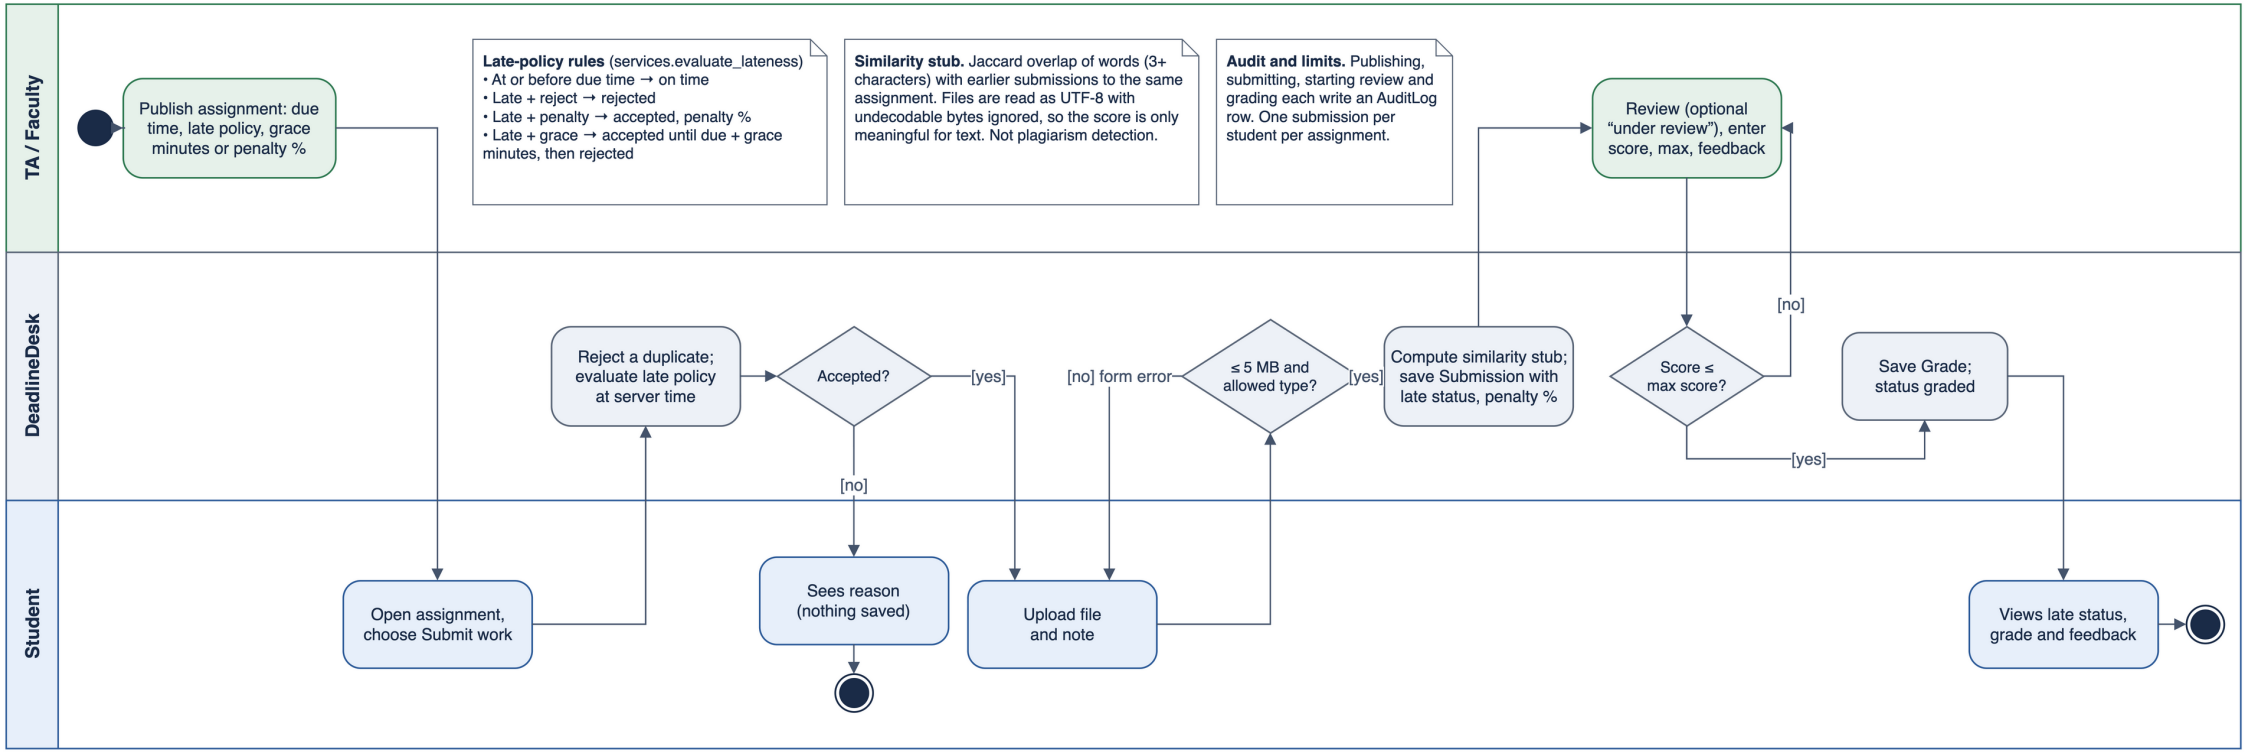

PRESENTATION	Django templates, HTML and CSS render role-specific pages and forms.
WEB / BACKEND	Python views and URL routes handle requests, sessions and role guards.
DOMAIN	Forms and services validate uploads, apply late policies and calculate the similarity stub.
DATA	Django ORM stores users, rounds, checklists, assignments, submissions, grades and audit events in SQLite.

No separate React frontend or REST backend is part of the Week 7 prototype.

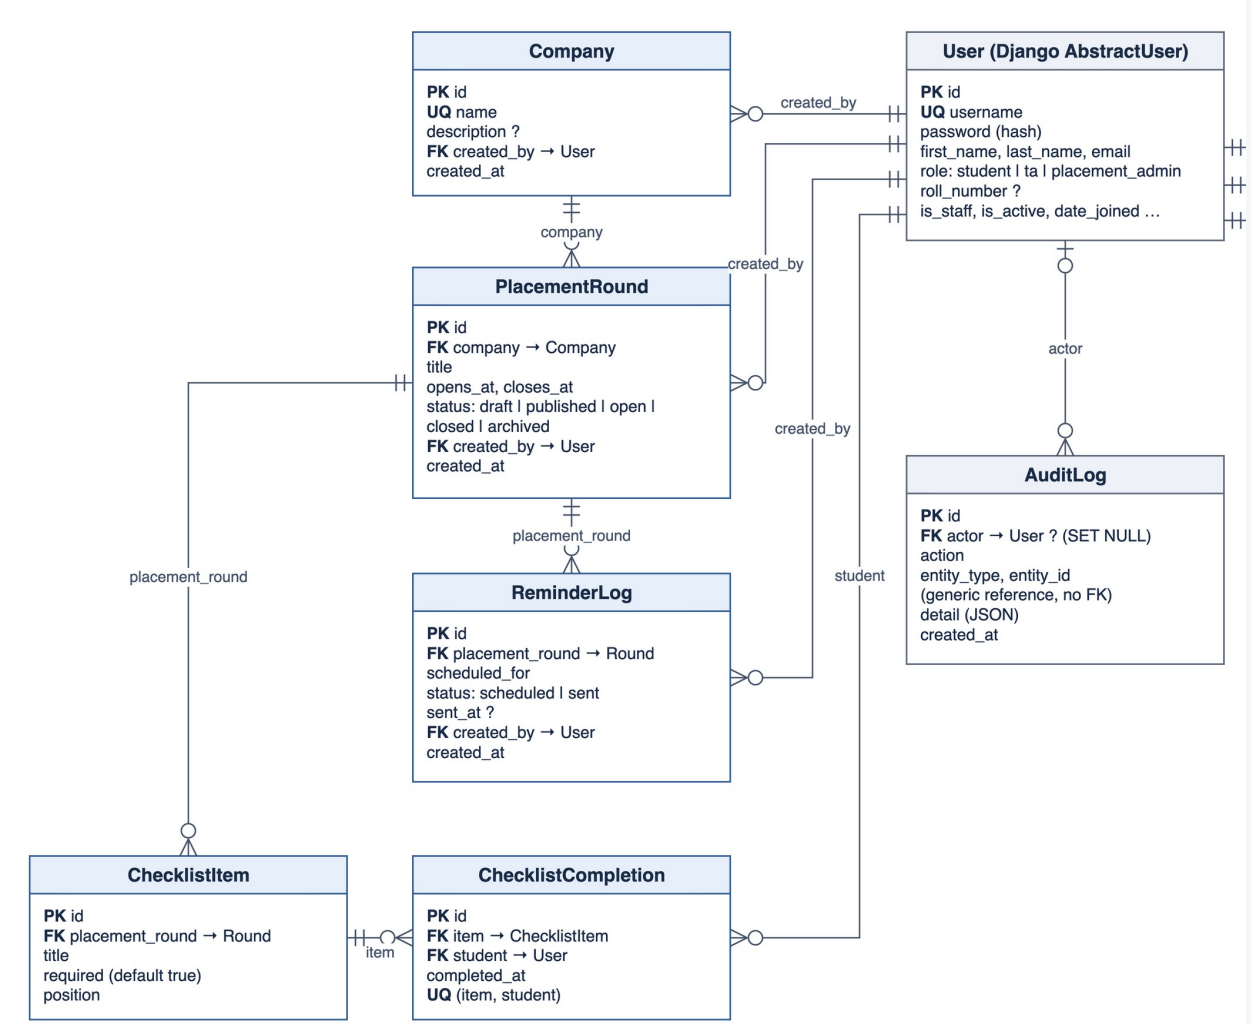

Placement readiness workflow

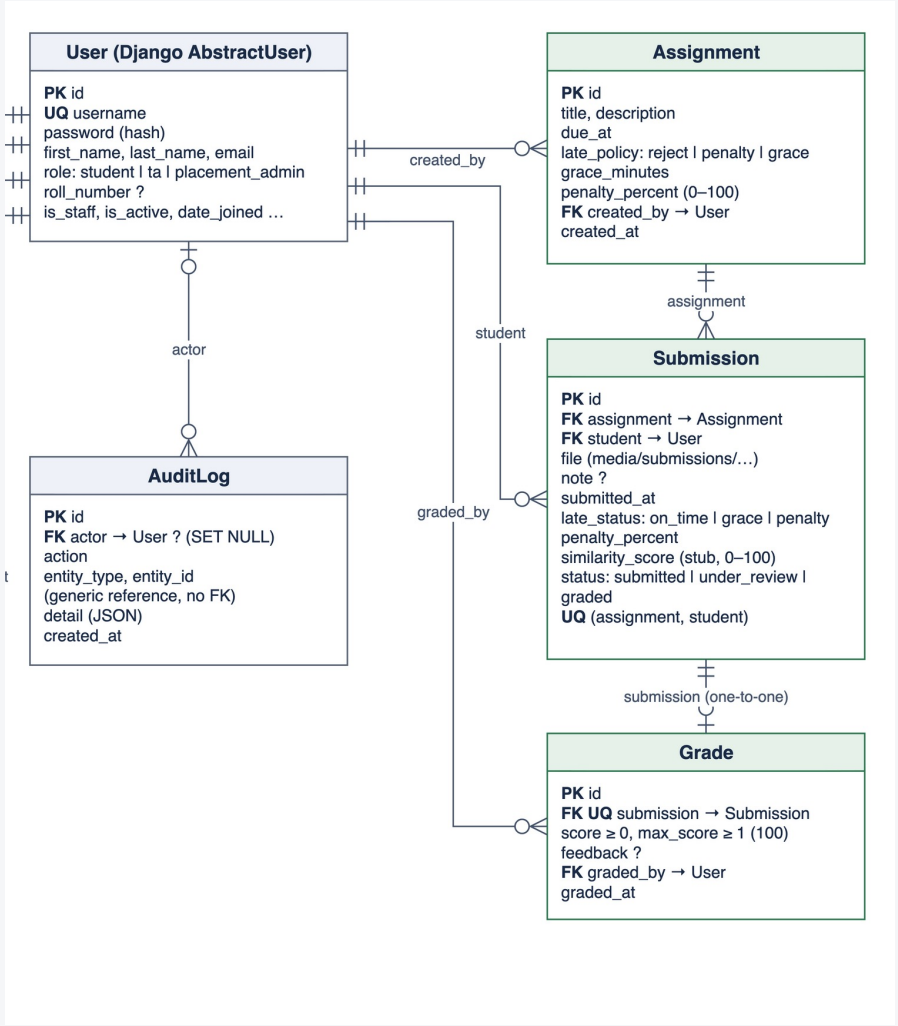

Academic submission and grading

Placement data model

Academic data model

Weeks 5 and 6 delivery

WEEK 5

Foundation

SRS and role model

Session authentication and route guards

Academic late-policy rules

Architecture and user flows

WEEK 6

Both workflows

Placement rounds, checklists and reminder logs

Academic uploads and automatic late outcomes

TA review, grading and feedback

Responsive role-specific pages

Week 7 verification

12

automated tests

6

late-policy boundary cases

3

authenticated roles

Browser and CI checks

Placement checklist moved from in progress to ready, with a reminder record.

Student upload passed through late evaluation, TA review, grading and feedback.

Role violations returned 403. Responsive pages were checked at 390 × 844.

CI covers migrations, Django checks, tests and the documentation build.

Week 7 scope and follow-on work

IN THE WEEK 7 PROTOTYPE

Working thin paths

Role-based login and protected actions

Placement readiness and reminder logging

Assignment upload, late decision, review and grading

SQLite and local media for demonstration

AFTER WEEK 7

Planned improvements

Real reminder worker and email delivery

PostgreSQL and managed file storage

Additional authorization, malware and concurrency checks

The similarity score remains a simple text-overlap stub

Thank You
